

4 P.M.
WATER UPDATE

June 30, 2017

Earlier today, 13 additional samples were hand-carried to Columbus.

We have been advised by the Ohio EPA that the levels of lead in 12 of the samples were “undetectable” and 1 had a reading under action-level.

The City also re-tested the two locations that previously showed elevated levels of lead. The Ohio EPA analyzed the samples and found that that the level in one home is under action level and the other is “undetectable” in the kitchen, but has an elevated reading in the basement, which is likely caused by lead in the pipes or solder.

We also tested the water leaving the Water Plant. Consistent with every test for lead ever conducted at the Plant, the level was “undetectable.”

These are still considered “interim” results until the final two samples are analyzed by the EPA. The last two samples will be hand-carried to Columbus tomorrow for EPA analysis.

We will continue to provide updates to our customers as they become available.
